

PIXIS: 400

The PIXIS series from Princeton Instruments (PI) are fully integrated, low noise cameras with a 1340 pixel format designed for quantitative scientific optical spectroscopy applications. Based on PI's exclusive XP cooling technology, PIXIS cameras offer thermoelectric cooling down to -75°C, with an all-metal, hermetically sealed design and the industry's only lifetime vacuum guarantee. High QE and ultra low-noise electronics make the PIXIS series of cameras ideal for demanding, low light applications such as Raman spectroscopy, photo- and electroluminescence, fluorescence and reflectance spectroscopy. Princeton Instruments' exclusive eXcelon® technology delivers the highest sensitivity available from the deep UV to the NIR, while suppressing the etaloning that occurs in conventional back-thinned devices. Dual speed operation at 100 kHz or 2 MHz enables these cameras to be used for either long acquisitions or fast kinetic studies.

FEATURE	BENEFITS		
eXcelon™ technology	Increases detector sensitivity while suppressing etalon interference fringes observed in the NIR with conventional back-illuminated devices		
Permanent vacuum	Our all-metal brazed seals eliminate the outgassing that occurs with epoxy seals and allow us to offer the industry's only lifetime vacuum guarantee		
Deep thermoelectric cooling	Low temperature operation minimizes dark current without the need for liquid nitrogen		
Single fused silica vacuum window	m window Minimizes reflection losses from the UV to the NIR; Optional AR coating and wedge windows are available		
1340 x 400 imaging array, 20 μm x 20 μm pixels	Proprietary format with 8 mm height for multiplexed spectroscopy over multiple regions of interest; 20 μ m pixel size offers the optimal combination of high resolution with dynamic range		
Optional UV phosphor coatings	Enhances sensitivity throughout the UV to below 200 nm.		
TTL input and output and shutter control	External control and triggering		
100 kHz and 2 MHz digitization rates	Choose low speed digitization for low noise or high speed for fast spectral acquisition		
Dual amplifiers with software-selectable system gains	High sensitivity amplifier reduces read noise for weak signals while a high capacity amplifier increases dynamic range		
USB2.0 data interface	Plug-and-play operation with desktops or laptops; Optional fiber optic interface for remote operation		
Optional: LightField® (for Windows 8/7, 64-bit) Or WinView/Spec (for Windows 8/7/XP, 32-bit)	lexible software packages for data acquisition, display and analysis; LightField offers intuitive, cutting edge user interface, IntelliCal® and more.		
PICAM (64-bit) / PVCAM (32-bit) software development kits (SDKs)	Compatible with Windows 8/7/XP, and Linux; Universal programming interfaces for easy custom programming.

QE DATA

Wavelength (nm)

NOTE

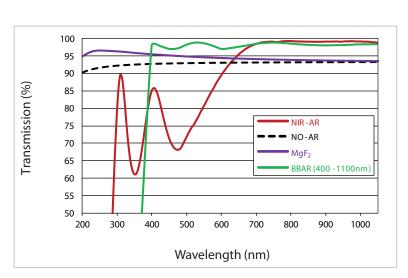

Graph shows typical Quantum Efficiency (QE) data measured at $+25^{\circ}$ C. QE decreases at normal operating temperatures. For the best results for your application, please discuss the specific parameters of your experiment with your sales representative.

VACUUM WINDOW AR COATINGS

NOTES:

- Standard anti-reflection (AR) coating options shown on graph
- Designed by Acton Optics, our BBAR coating offers unmatched performance for 400 nm - 1100 nm
- Custom wedge window options and other AR coatings are also available

eXcelon Performance

Back-illuminated

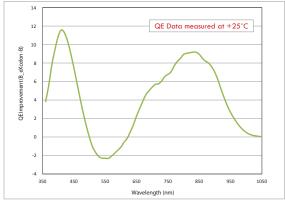

Data taken with white light source through a monochromator, comparing etaloning performance of eXcelon vs. back-illuminated CCDs.

Back-illuminated_eXcelon

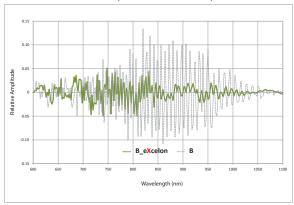

QE Improvement (B_eXcelon vs. B)

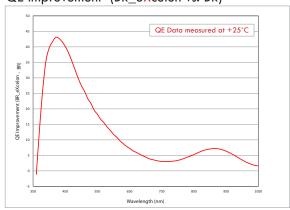

B_eXcelon provides superior QE over the standard back illuminated ("B") version in the UV-NIR range.

Etalon Oscillations (B_eXcelon vs. B)

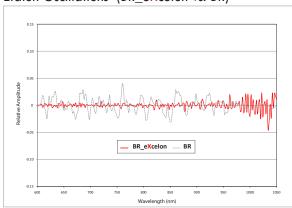

B_eXcelon provides significantly lower etaloning (unwanted fringes) compared to standard back illuminated ("B") version.

QE Improvement (BR_eXcelon vs. BR)

BR_eXcelon provides superior QE over standard back illuminated deep depletion ("BR") version over the entire UV-NIR range.

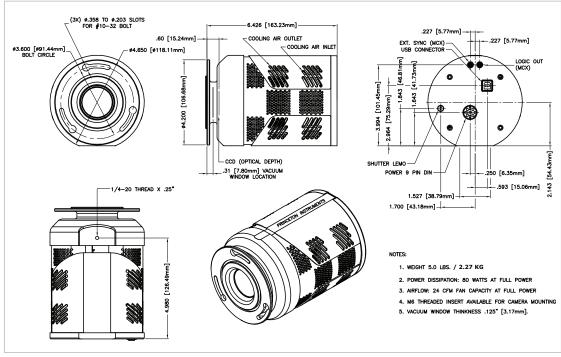

Etalon Oscillations (BR_eXcelon vs. BR)

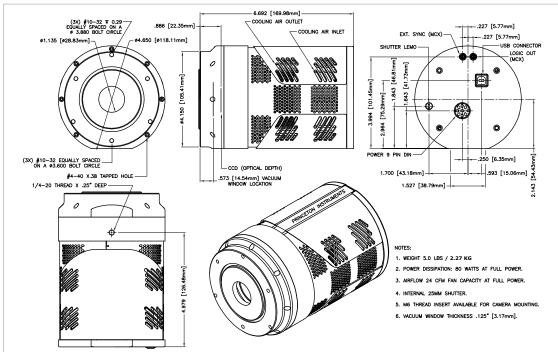

BR_eXcelon eliminates much of the residual etaloning observed in the standard back-illuminated deep depletion ("BR") version.
